

CSE231: Data Structures

Lecture 02

by

Mehedi Hasan Bijoy

Abstract Data Types (ADT)

- An abstract data type (ADT) refers to a set of data values and associated operations that are specified accurately, independent of any particular implementation.
- ADT defines what a specific data type can do, but how it actually does it is hidden.
 - It consists of a set of definitions that allow us to use the functions while hiding the implementation details.

List ADT

- Implementation:
 - Array Based
 - Linked List Based
- Operations:
 - Insert
 - Delete
 - Retrieve

List Representation

(a) Linear List

(b) Matrix

(c) Tree

(d) Graph

Abstract Data Type Model

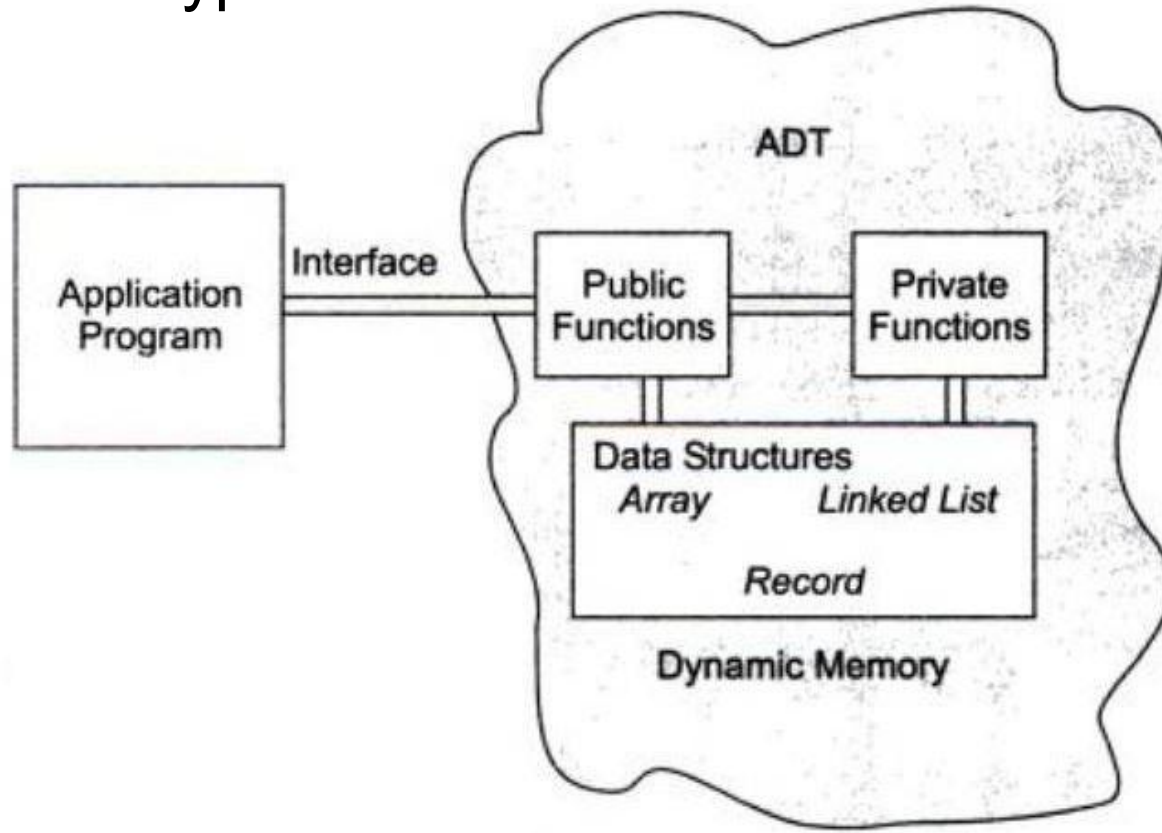

Fig. 1.13 ADT Model

Abstract Data Type Model

- Data are entered, accessed, modified, and deleted through the external application programming interface
- Two different parts of the ADT model: Functions and Data Structures
 - For each ADT operation, there is an algorithm that perform its specific task. The operation name and parameters are available to the application.
 - Data structures are available to all of the ADTs functions as required

Algorithms: Complexity, Time-Space Tradeoff

- An algorithm is a well-defined set of steps for solving a particular problem.
- Time and space an algorithm uses are two major measures of the efficiency calculation.
- The complexity of an algorithm is the function which gives the running time and/or space in terms of input size.
- Choice of data structure involves a time-space tradeoff.

Search Algorithms

- Linear Search

It is defined as a sequential search algorithm that starts at one end and goes through each element of a list until the desired element is found, otherwise the search continues till the end of the data set.

5	10	6	8	2	4	15	20	12	1
----------	-----------	----------	----------	----------	----------	-----------	-----------	-----------	----------

Search Algorithms

- Linear Search

It is defined as a sequential search algorithm that starts at one end and goes through each element of a list until the desired element is found, otherwise the search continues till the end of the data set.

5	10	6	8	2	4	15	20	12	1
---	----	---	---	---	---	----	----	----	---

Time Complexity (Worst-case): $O(N)$

Space Complexity: $O(1)$

Search Algorithms

- Binary Search

Binary search is a search algorithm that finds the position of a target value within a sorted array. Binary search compares the target value to the middle element of the array.

5	10	11	12	13	14	15	20	30	50
----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------

Search Algorithms

- Binary Search

Binary search is a search algorithm that finds the position of a target value within a sorted array. Binary search compares the target value to the middle element of the array.

5	10	11	12	13	14	15	20	30	50
----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------

Time Complexity (Worst-case): $O(\log N)$

Space Complexity: $O(1)$

Time-Space Tradeoff

- Suppose a file of records contains name, social security number, and much additional information among its fields.
- Sorting the file alphabetically and running binary search is efficient way to find the record for a given name.
- What if we are only given the social security number of the person? We have to perform linear search. (Time-consuming)
- Solution: Have another file which is sorted numerically according to social security number. (Space-consuming)

Time-Space Tradeoff

	Name	Pointer
1	Abbey, Gregory	2
2	Brown, John	4
3	Carey, Mary	546
4	Davis, Earl	1
5	Ellis, Susan	76

Auxiliary array
sorted alphabetically

	Soc. Sec. No	Name	Extra Data
1	013-44-5555	Davis, Earl	XXXXXXXXXXXXXXXXXX
2	025-55-6198	Abbey, Gregory	XXXXXXXXXXXXXXXXXX
3	027-73-3961	Lane, Alice	XXXXXXXXXXXXXXXXXX
4	174-62-3485	Brown, John	XXXXXXXXXXXXXXXXXX
5	182-74-6398	Smith, Mary	XXXXXXXXXXXXXXXXXX

Main file
sorted by social security number

Thank You!
